

BATS IN CHURCHES

St Remigius DUNSTON Norfolk

The Issue

A comparatively small roost of Brown Long-eared bats caused a huge amount of mess in this small church by flying inside for most of the night. The PCC were unable to hold services or events and the alabaster East window was at risk of being damaged.

What We Did

Camera surveys confirmed that the Brown Long-eared bats were able to use the existing wall top void as a flight space.

We are containing the Brown Long-Eared bats in the existing wall top void and blocking their access into the church. We have also created more roosting space for Common Pipistrelles in the tower

The church has also had a full, professional clean to allow the PCC to hold services and events in the church.
